Preface

Criterion-referenced assessments evaluate a student's performance against a set of predetermined criteria or standards. In contrast, norm-referenced assessments compare a student's performance to the performance of a larger group, typically their peers. Criterion-referenced assessments are used to determine whether a student has mastered a specific set of skills or knowledge, while norm-referenced assessments are used to rank students against each other. This book focuses on criterion-referenced assessments, which are commonly used in educational settings to measure student learning and inform instruction.

Criterion-referenced assessments are used to evaluate student performance on specific learning objectives, such as the ability to solve a particular type of math problem or to write a coherent essay. These assessments are designed to measure what students know and can do, rather than how they compare to their peers. Criterion-referenced assessments are used to determine whether students have met specific learning objectives, and to provide feedback to students and teachers on areas where improvement is needed. This book provides an overview of criterion-referenced assessments, including their purpose, design, and implementation. It also includes examples of criterion-referenced assessments in various subject areas, as well as tips for creating and using these assessments in the classroom.

1 Introduction

This is a book created from markdown and executable code.

See Knuth (1984) for additional discussion of literate programming.
